

ABSTRACT OF THE DISCLOSURE

A method and apparatus for furnishing a user with notification of events occurring within an computer-based information handling system, convergence system, or the like is disclosed. Multiple software applications executing within the system are monitored
5 for the occurrence of selected events, whereupon a notification of the event may be generated and displayed to the user via a single integrated user interface. The user may take action on the event by selecting the displayed notification whereupon the system communicates the desired action to the application for execution.
